

ATHLETE COMBINE PERFORMANCE REPORT

Field testing summary compared with Forge Coach Handbook (2019) benchmarks

Taylor Brooks	ID: FPL-2286	Age 31 · Male
Sport: CrossFit (competitive)	Tested: 2026-07-16	Ridgeline Athletics

Administered by M. Sandoval · Conditions: standard testing environment

Performance Overview

Taylor Brooks completed the combine battery on 2026-07-16. Results are compared with the typical range for male athletes aged 30–39 (Forge Coach Handbook 2019, Appendix C). Scores rated **Superior** (better than the typical band): 40 m Sprint, Single-Leg Balance (L). Scores rated **Below** typical: Grip Strength (R), Single-Leg Balance (R). These ranges describe common recreational-to-competitive performance bands, not elite standards. Interpretation always considers the athlete's sport, training history, and any testing notes.

Detailed Results vs. Benchmarks

Test	Result	Typical Range (30–39)	Rating	Interpretation
40 m Sprint	4.78 s	4.8 – 5.7 s	Superior	Faster than typical range (lower time is better)
Vertical Jump	61.0 cm	41 – 61 cm	Typical	Within typical range
Broad Jump	245 cm	195 – 250 cm	Typical	Within typical range
Grip Strength (L)	52.0 kg	40 – 57 kg	Typical	Within typical range
Grip Strength (R)	36.0 kg	40 – 57 kg	Below	Below typical range (Athlete mentioned right wrist soreness during testing; completed all trials.)
Isometric Mid-Thigh Pull	2,900 N	—	Recorded	No handbook benchmark available
Sit-and-Reach	7.0 cm	-3 – 13 cm	Typical	Within typical range
Single-Leg Balance (L)	41.0 s	14 – 38 s	Superior	Above typical range
Single-Leg Balance (R)	12.0 s	14 – 38 s	Below	Below typical range

Note: Mid-thigh pull (isometric force) is not covered in the 2019 handbook; the recorded value is provided for longitudinal tracking. Lower time is better for the 40 m sprint; higher values are better for all other scored tests.

Key Takeaways

Standout qualities. 40 m Sprint, Single-Leg Balance (L) exceed the typical range for age and sex. These are the clearest physical assets relative to the recreational-to-competitive peer group.

Areas below typical. Grip Strength (R), Single-Leg Balance (R) sit outside the typical band in the unfavorable direction and warrant attention in the next training block.

Grip asymmetry / discomfort. Right-hand grip was affected by reported wrist soreness. Treat the number as provisional until the wrist is fully settled.

Balance asymmetry. Left 41 s vs right 12 s is a meaningful side-to-side difference. Single-leg work should emphasize the weaker side.

Coaching Recommendations

- **Context for competitive CrossFit.** The sport rewards balanced strength, power, grip endurance, and the ability to express force in varied positions. Asymmetries and mobility restrictions tend to surface under fatigue.
- **Protect and progress current strengths.** 40 m Sprint, Single-Leg Balance (L) sit above the typical band for age/sex. Continue quality speed and/or power work with adequate recovery so these qualities remain assets rather than being eroded by high-volume general training.
- **Single-leg control.** Balance scores fall below the typical range. Include single-leg strength, landing, and perturbation work 2× per week to reduce injury risk and improve force transfer.
- **Upper-body asymmetry note.** Right-hand grip is notably lower (wrist soreness reported). Allow the wrist to settle, then rebuild grip and forearm capacity symmetrically before heavy pulling or high-volume hanging work.

- **Balanced capacity.** Use the mid-thigh pull and grip numbers as training monitors. Address any left/right differences before high-volume Olympic lifting or gymnastics pulling cycles.
- **Retest cadence.** Repeat the full battery (or the completed subset) after an 8–12 week focused block. Track the mid-thigh pull longitudinally even though it lacks a published typical range.

This report is intended for coaching and athlete development use. Benchmarks are drawn from the Forge Coach Handbook (2019 edition), Appendix C, and represent typical ranges for recreational-to-competitive adult athletes—not elite or sport-specific norms. Individual context (training history, recent fatigue, technical factors, injury status) should always inform interpretation.
